

Decision Forests for Tissue-specific Segmentation of High-grade Gliomas in Multi-channel MR

SUPPLEMENTARY MATERIAL

1. Sensitivity to Variation of Parameters

Sensitivity to Parameters is tested by varying the number of trees $n \in [15, 40]$ and the tree depth $d \in [12, 20]$ for the 10 30/10-cross-validation tests. We observe robustness to the selection of these values, in particular the number of trees (please note the small ranges of color bars).
